 EXAMPLE OVERVIEW, NOT FOR CLINICAL USE.   202314433 v4

Plaque Types	LM	LAD	LCX	RCA	Total
Calcified Plaque	0	203	84	74	361 (28%)
Non Calcified Plaque	0	395	233	315	943 (72%)
Low Attenuation Plaque	0	9	4	6	19 (1%)
<b>Total Plaque (mm<sup>3</sup>)</b>	<b>0</b>	<b>598</b>	<b>317</b>	<b>389</b>	<b>1304</b>

Quantitative plaque is provided on vessels > 1.8 mm.  
 This HeartFlow Analysis was provided following the provider's confirmation of review of the corresponding coronary CTA.

Plaque volume by type (mm<sup>3</sup>, in vessels that are >1.8mm in diameter) | 2D visualization of plaque location / distribution

# DECODE study: Change in medical Tx based on plaque analysis

Stage	Treatment
0	<i>GDMT</i>
1	<i>Low dose statin</i>
2	<i>High-intensity statin</i>
3	<i>High-intensity statin + PCSK-9 inhibitor + additional medications</i>
3+	<i>Escalation of therapy following review of Plaque report if stage 3 was chosen initially</i>

Nearly 50% of patients with a CAC of 0 were reclassified

# FFR-CT: ESC CCS guideline recommendations 2024

## Recommendations for definition of high risk of adverse events

The use of one or more of the following test results is recommended to identify individuals at high risk of adverse events:

- Exercise ECG:
  - Duke Treadmill Score  $< -10$ ;
- stress SPECT or PET perfusion imaging:
  - Area of ischaemia  $\geq 10\%$  of the LV myocardium;
- Stress echocardiography:
  - $\geq 3$  of 16 segments with stress-induced hypokinesia or akinesia;
- stress CMR:
  - $\geq 2$  of 16 segments with stress perfusion defects or  $\geq 3$  dobutamine-induced dysfunctional segments;
- CCTA:
  - left main disease with  $\geq 50\%$  stenosis, three-vessel disease with  $\geq 70\%$  stenosis, or two-vessel disease with  $\geq 70\%$  stenosis, including the proximal LAD or one-vessel disease of the proximal LAD with  $\geq 70\%$  stenosis and **FFR-CT**  $\leq 0.8$ .

I

B

*Virtual PCI can be conducted by combining anatomical information from CCTA with that of FFR-CT. FFR-CT/CCTA-based virtual PCI has two theoretical advantages over ICA-based virtual PCI: (i) it does not require invasive investigation, and (ii) it provides information on vessel wall/plaque composition. FFR-CT/CCTA-based virtual PCI has been shown to accurately predict post-PCI FFR<sub>s</sub> and to modify PCI procedural planning in 31% of lesions and 45% of patients.*
